I will present learnings from my experience in handling data from the upgraded GMRT. I would present several examples from observations made at all bands, bands 2, 3 4 and 5 of the upgraded GMRT, where I will present complexities in data reduction at these bands, and I will present difficulties in flagging bad data at these bands of the upgraded GMRT. I will summarise with some broad suggestions for the new users when handling (the legacy or) the upgraded GMRT data.
