In this century the internet has brought about an information explosion and a time-squeeze for everyone connected. Even ten-minute YouTube expositions lose out to 30-second TikTok clips, and only a certain class of people follow multi-hour podcasts. As a writer of a small series of blogs [1] and an occasional interviewee in the media, this presentation will be about what considerations go into writing a blog and publicizing it so that interested people will know of it.

Artificial Intelligence can be a great boon to finding information when google searches would yield too many false positives, because it can understand complete sentences. Asking it to solve equations, or even verify your own equations, is often beyond its current capabilities, yet asking it questions like “where can I find an authoritative paper about clock steering” can point to the desired information. Yet even here caution must be exercised.
