

An Improved Web Page for Electromagnetic Metrology Training Resources

Demetrios Matsakis, U.S. Naval Observatory

On behalf of the Commission A Working Group for Electronic Metrology Training

Electromagnetic Metrology is a highly specialized field, in which training comes via conferences, tutorials, and seminars, as well as through classroom instruction. The authors of this paper are members of a Working Group that established a Commission A training web page system that was announced at the General Assembly of 2017[. This web page system is visible at as a tab on the Commission A pages, which itself is a tab on the URSI web pages.

Training can take many forms, such as short term training events, conferences and symposia, refereed journals.

The web page has separate tabs for the fields of Antenna Metrology, Electromagnetic Coupling Metrology, Time and Frequency Metrology, with subsections that define the fields and list resources. There is one page for training that is common to many subfields, and another for job postings.

In this meeting we report on experience since then and solicit advice for the future. An important issue is that the web page be easily edited. This requires a source code that is separable from the other web pages.

Even more important is finding ways to call attention to this resource.
