Onsala Space Observatory (OSO), the Swedish National Facility for Radio Astronomy, operates a 20 m-diameter millimetre-wave telescope a 25 m-diameter cm-wave telescope two 13.2 m-diameter VGOS antennas as well as a LOFAR station at Onsala, Sweden. OSO is also responsible for the Swedish involvement in the Atacama Pathfinder Experiment (APEX), an excellent sub-millimetre telescope on an exceptionally good site, Llano Chajnantor in Chile. Furthermore, OSO is involved in several international projects such as European VLBI Network (EVN), International VLBI Service (IVS) for Geodesy and Astrometry, Atacama Large Millimeter/submillimeter Array (ALMA) and Square Kilometre Array (SKA). We will describe the present status of the observatory and outline some of the planned future directions.
